

Witex laminate flooring suitable for moisture-prone areas

Witex's **Aqua-Protect™** Core Board is used in the **Marena V4**, **Marena Maxi V2** and **Xenia** ranges.

The core board is highly durable, very dense and is highly resistant to swelling from moisture. This is due to its special waterproofing and composition. This extensive moisture resistance prevents the seams from swelling. In addition, the edges of the board have been made water resistant using a high-quality synthetic oil.

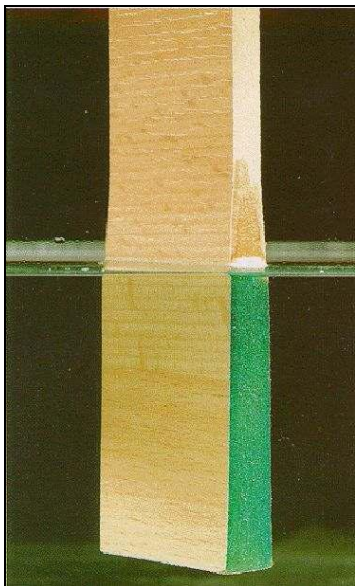

Together with its patented **Loctec™** locking mechanism, this flooring displays the same high-quality Witex standards and can be used in moisture-prone areas.

When using the flooring in moisture-prone areas please take note of the following

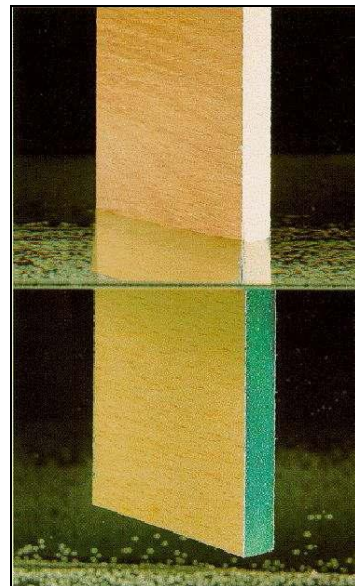

- **The installation and cleaning instructions**
- **Maintain sufficient expansion gaps between the flooring and all other parts**
- **Use silicon to create a thin seal between the laminate flooring and any other parts (skirting boards, profiles, tubing, etc.)**
- **Make absolutely sure that no water is getting under the laminate**
- **Mop up all puddles of water from the surface of the floor**

By doing this you ensure that the flooring will last for a long period of time in moisture prone areas.

The floor's water resistance is demonstrated in the photos below.

Conventional HDF Coreboard

Aqua Protect Coreboard
